CALIFORNIA’S BIOACCUMULATION MONITORING PROGRAM

What is the Bioaccumulation Monitoring Program?
California’s Bioaccumulation Monitoring Program (Program) monitors whether fish and shellfish found in California’s streams, lakes, and coastal areas are safe to eat.

The data collected by the Program are used to develop fish consumption advisories, which provide guidelines that recommend how often individuals can safely eat fish caught from water bodies in California.

How do you consume fish?
To develop useful advisories, it is helpful to know where people fish, what they fish for, and how they consume what they catch.

By filling out a brief survey, you will be providing much-needed information that will help us ensure the species and water bodies that get monitored include those that are important to you.

Scan the QR Code and tell us what is important to you!
